

### 3. 3D-Construction SpiderClip

The concept of SpiderClip is that the assembled components can be attached to the Vive tracker and thus merge with it hardware-wise into a unified device. This case consists of three parts and offers space for all selected hardware components. The 3 components have to be printed individually with a common 3D printer. Here is the link of the individual STL files.

At this point it is important to mention that the components should not be assembled yet. The „marriage“ of the hardware components and the 3D printed parts will be explained in the next chapter.
